

Contractor Evaluations Using PDM 3.0

PDM 3.0 offers sophisticated yet easy to use tools to evaluate contractor performance. The PDM 3.0 evaluation processes are specifically designed to help construction professional's track, manage, and share how contractors perform on projects.

There is increasing pressure to improve productivity within the construction industry. Firms are being forced to do more with less in order to remain profitable. Historically construction has relied on inefficient paper based processes to communicate vital project information. Today, there is great opportunity for construction to improve efficiencies and cut costs by updating paper based processes with technology that centralizes and manages electronic project information.

Project owners as well as construction firms are looking for ways to mitigate their risk. As a result they are implementing ways of better managing the contractors working on their projects. Traditionally this is done manually with paper forms that are filled out and filed. This process is time consuming, labor intensive, and the paper documents are inefficient to share throughout the organization.

PDM 3.0 offers an evaluation process that is specifically designed for construction. Each PDM 3.0 system is setup with evaluation bench marks that allow each project team to perform contractor evaluations throughout the project lifecycle. The results of these evaluations can then be shared with the entire project team as well as the rest of the organization. This helps assure contractors are performing quality workmanship throughout the project.

The PDM 3.0 evaluation process captures and stores all evaluations. This allows all project teams within the organization to quickly check a contractor's previous project performance history at the individual project level as well as on all projects overall.

The PDM 3.0 contractor evaluation process is a key feature of PDM's powerful risk mitigation tools. PDM assures organizations ability to invite, award, and work with the best contractors in each market.

PDM 3.0 capabilities are specifically designed to help construction become more efficient, mitigate risk, and be more profitable. PDM 3.0 offers an interoperable approach by combining many of the fragmented processes associated with today's construction process into one single application.
